In this senior capstone adaptive reuse project, the former Marlon Hills Elementary School was used as the basis of a mental health facility named Clear Thinking, dedicated to helping teens overcome mental health challenges. As a former elementary school built in the 1960s, the building needs a lot of adjustments before it will be ready for use. While the main issue is reorganization of space, many aspects of the building will also need to be updated to fit teenagers and adults as opposed to child-sized equipment—namely, the restrooms. A focus should be placed on security of the building for the safety of the occupants, ideally while still maintaining a comfortable environment. While some patients will stop by during the day for individual appointments, others may be given the opportunity to stay overnight in an individual space to call their own for varying lengths of time as they heal and learn valuable coping mechanisms. As such, dormitories should be constructed to be customizable as having a sense of control can help reduce anxiety (Ulrich, 1991) (Payne et al., 2014). All one-on-one therapy sessions should be held in designated private consultation rooms; additional semi-private areas will be provided for impromptu check-ins between staff and patients. This is because “privacy is very important... for well-being centers” (Payne et al., 2014). The overall atmosphere of light and healing will be reinforced by the incorporation of nature, maximized natural light, and gentle acoustics (Ulrich, 1991) (Watts et al., 2016) (Payne et al., 2014).
